

Electroencephalography (EEG) Test

An EEG is used to look at your brain to see how
your brain is working.

vector illustration

I will meet a technician who works with my doctor. The technician will help me get ready for my EEG.

Funny looking wires will be attached to my head with special gel. This might feel funny but it won't hurt!

I will then be asked to close my eyes, relax, and stay still so that the technician can study what my brain is doing!

Throughout the test, the team will be checking to make sure that I am doing OK.

I may be asked to take a deep breathe or to
look at a flashing light.

When the test is finished, the technician will remove the wires from my head. I did a great job getting an EEG!
